## **MoveObject**

The representation of an object as a Move Object, which exposes additional information (content, module that governs it, version, is transferrable, etc.) about this object.

```
type MoveObject implements IMoveObject, IObject, IOwner {
 address: SuiAddress!
 objects(
   first: Int
   after: String
   last: Int
   before: String
   filter: ObjectFilter
  ): MoveObjectConnection!
 balance(
   type: String
 ): Balance
 balances(
   first: Int
   after: String
   last: Int
   before: String
 ): BalanceConnection!
 coins(
   first: Int
   after: String
   last: Int
   before: String
   type: String
 ): CoinConnection!
 stakedSuis(
   first: Int
    after: String
    last: Int
   before: String
 ): StakedSuiConnection!
 defaultSuinsName(
   format: DomainFormat
  ): String
 suinsRegistrations(
   first: Int
   after: String
   last: Int
    before: String
  ): SuinsRegistrationConnection!
 version: UInt53!
  status: ObjectKind!
 digest: String
```

```
owner: ObjectOwner
  previousTransactionBlock: TransactionBlock
  storageRebate: BigInt
  receivedTransactionBlocks(
    first: Int
    after: String
    last: Int
    before: String
    filter: TransactionBlockFilter
    scanLimit: Int
  ): TransactionBlockConnection!
  bcs: Base64
  contents: MoveValue
  hasPublicTransfer: Boolean!
  display: [DisplayEntry!]
  dynamicField(
    name: DynamicFieldName!
  ): DynamicField
  dynamicObjectField(
    name: DynamicFieldName!
  ): DynamicField
  dynamicFields(
    first: Int
    after: String
    last: Int
    before: String
  ): DynamicFieldConnection!
  asCoin: Coin
  asStakedSui: StakedSui
  asCoinMetadata: CoinMetadata
  asSuinsRegistration: SuinsRegistration
}
```

#### **Fields**

```
MoveObject.address • SuiAddress! non-null scalar

MoveObject.objects • MoveObjectConnection! non-null
object

Objects owned by this object, optionally filter-ed.

MoveObject.objects.first.Int scalar

MoveObject.objects.after.String scalar

MoveObject.objects.last.Int scalar

MoveObject.objects.before.String scalar
```

```
MoveObject.balance Balance
                                            object
Total balance of all coins with marker type owned by this object. If type is not supplied, it defaults to
0x2::sui::SUI.
MoveObject.balance.type.String
MoveObject.balances BalanceConnection!
                                                              non-null
                                                                           object
The balances of all coin types owned by this object.
MoveObject.balances.first.Int
MoveObject.balances.after.String
MoveObject.balances.last.Int
MoveObject.balances.before.String
MoveObject.coins CoinConnection!
                                                                  object
                                                     non-null
The coin objects for this object.
type is a filter on the coin's type parameter, defaulting to 0x2::sui::SUI.
MoveObject.coins.first.Int
MoveObject.coins.after.String
MoveObject.coins.last).(Int)
MoveObject.coins.before String
MoveObject.coins.type String
MoveObject.stakedSuis • StakedSuiConnection!
                                                                    non-null
 object
The [0x3::staking_pool::StakedSui] objects owned by this object.
MoveObject.stakedSuis.first.Int
MoveObject.stakedSuis.after.String
MoveObject.stakedSuis.last.Int
```

MoveObject.objects.filter.ObjectFilter

MoveObject.stakedSuis.before scalar

MoveObject.defaultSuinsName String scalar

The domain explicitly configured as the default domain pointing to this object.

MoveObject.defaultSuinsName.format DomainFormat enum

MoveObject.suinsRegistrations • SuinsRegistrationConnection! non-null object

The SuinsRegistration NFTs owned by this object. These grant the owner the capability to manage the associated domain.

MoveObject.suinsRegistrations.after.String scalar

MoveObject.suinsRegistrations.last.Int scalar

MoveObject.suinsRegistrations.before.String scalar

MoveObject.suinsRegistrations.before.String scalar

MoveObject.version.UInt53! non-null scalar

MoveObject.status.ObjectKind! non-null enum

The current status of the object as read from the off-chain store. The possible states are: NOT\_INDEXED, the object is loaded from serialized data, such as the contents of a genesis or system package upgrade transaction. LIVE, the version returned is the most recent for the object, and it is not deleted or wrapped at that version. HISTORICAL, the object was referenced at a specific version or checkpoint, so is fetched from historical tables and may not be the latest version of the object. WRAPPED\_OR\_DELETED, the object is deleted or wrapped and only partial information can be loaded."

MoveObject.digest String scalar

32-byte hash that identifies the object's contents, encoded as a Base58 string.

MoveObject.owner ObjectOwner union

The owner type of this object: Immutable, Shared, Parent, Address

MoveObject.previousTransactionBlock object

The transaction block that created this version of the object.

## MoveObject.storageRebate BigInt scalar

The amount of SUI we would rebate if this object gets deleted or mutated. This number is recalculated based on the present storage gas price.

# MoveObject.receivedTransactionBlocks onnection! non-null object TransactionBlockC

The transaction blocks that sent objects to this object.

scanLimit restricts the number of candidate transactions scanned when gathering a page of results. It is required for queries that apply more than two complex filters (on function, kind, sender, recipient, input object, changed object, or ids), and can be at most serviceConfig.maxScanLimit.

When the scan limit is reached the page will be returned even if it has fewer than first results when paginating forward (last when paginating backwards). If there are more transactions to scan, pageInfo.hasNextPage (or pageInfo.hasPreviousPage) will be set to true, and PageInfo.endCursor (or PageInfo.startCursor) will be set to the last transaction that was scanned as opposed to the last (or first) transaction in the page.

Requesting the next (or previous) page after this cursor will resume the search, scanning the next scanLimit many transactions in the direction of pagination, and so on until all transactions in the scanning range have been visited.

By default, the scanning range includes all transactions known to GraphQL, but it can be restricted by the after and before cursors, and the beforeCheckpoint, afterCheckpoint and atCheckpoint filters.

```
MoveObject.receivedTransactionBlocks.after String scalar

MoveObject.receivedTransactionBlocks.last Int scalar

MoveObject.receivedTransactionBlocks.before String scalar

MoveObject.receivedTransactionBlocks.filter TransactionBlockFilter Input

MoveObject.receivedTransactionBlocks.scanLimit Int scalar

MoveObject.receivedTransactionBlocks.scanLimit Int scalar
```

The Base64-encoded BCS serialization of the object's content.

```
MoveObject.contents • MoveValue object
```

Displays the contents of the Move object in a JSON string and through GraphQL types. Also provides the flat representation of the type signature, and the BCS of the corresponding data.

MoveObject.hasPublicTransfer • Boolean!	non-null	scalar
---	----------	--------

Determines whether a transaction can transfer this object, using the TransferObjects transaction command or sui::transfer::public\_transfer, both of which require the object to have the key and store abilities.

```
MoveObject.display [DisplayEntry!] list object
```

The set of named templates defined on-chain for the type of this object, to be handled off-chain. The server substitutes data from the object into these templates to generate a display string per template.

```
MoveObject.dynamicField DynamicField object
```

Access a dynamic field on an object using its name. Names are arbitrary Move values whose type have copy, drop, and store, and are specified using their type, and their BCS contents, Base64 encoded.

Dynamic fields on wrapped objects can be accessed by using the same API under the Owner type.

```
MoveObject.dynamicField.name. DynamicFieldName! non-null input
```

## MoveObject.dynamicObjectField DynamicField object

Access a dynamic object field on an object using its name. Names are arbitrary Move values whose type have copy, drop, and store, and are specified using their type, and their BCS contents, Base64 encoded. The value of a dynamic object field can also be accessed off-chain directly via its address (e.g. using Query.object).

Dynamic fields on wrapped objects can be accessed by using the same API under the Owner type.

```
MoveObject.dynamicObjectField.name.DynamicFieldName! non-null input

MoveObject.dynamicFields DynamicFieldConnection!

non-null object
```

The dynamic fields and dynamic object fields on an object.

Dynamic fields on wrapped objects can be accessed by using the same API under the Owner type.

```
MoveObject.dynamicFields.first.Int scalar

MoveObject.dynamicFields.after.String scalar

MoveObject.dynamicFields.last.Int scalar

MoveObject.dynamicFields.before.String scalar
```

MoveObject.asCoin Coin object

Attempts to convert the Move object into a <code>0x2::coin::Coin</code>.

MoveObject.asStakedSui StakedSui object

Attempts to convert the Move object into a <code>0x3::staking\_pool::StakedSui</code>.

MoveObject.asCoinMetadata CoinMetadata object

Attempts to convert the Move object into a 0x2::coin::CoinMetadata.

MoveObject.asSuinsRegistration SuinsRegistration object

Attempts to convert the Move object into a SuinsRegistration object.

#### Interfaces

IMoveObject interface

This interface is implemented by types that represent a Move object on-chain (A Move value whose type has key).

IObject interface

Interface implemented by on-chain values that are addressable by an ID (also referred to as its address). This includes Move objects and packages.

**IOwner** interface

Interface implemented by GraphQL types representing entities that can own objects. Object owners are identified by an address which can represent either the public key of an account or another object. The same address can only refer to an account or an object, never both, but it is not possible to know which up-front.

#### Member Of

MoveObjectConnection object . MoveObjectEdge object . Object object . Validator

### Implemented By

DynamicFieldValue union
